Low Power, 3.3 V, RS-232 Line Drivers/Receivers

ADM3202/ADM3222/ADM1385

FEATURES

460 kbps data rate
Specified at 3.3 V
Meets EIA-232E specifications
0.1 µF charge pump capacitors
Low power shutdown (ADM3222 and ADM1385)
PDIP, SOIC_N, SOIC_W, SSOP, and TSSOP options
Upgrade for MAX3222/MAX3232 and LTC1385
ESD protection to IEC 1000-4-2 (801.2)
on RS-232 pins (ADM3202 only)
±8 kV: contact discharge
±15 kV: air gap discharge

APPLICATIONS

General-purpose RS-232 data link
Portable instruments
Printers, palmtop computers, PDAs

GENERAL DESCRIPTION

The ADM3202/ADM3222/ADM1385 transceivers are high speed, 2-channel RS-232/V.28 interface devices that operate from a single 3.3 V power supply. Low power consumption and a shutdown facility (ADM3222/ADM1385) make them ideal for battery-powered portable instruments.

The ADM3202/ADM3222/ADM1385 parts conform to the EIA-232E and CCITT V.28 specifications and operate at data rates up to 460 kbps.

Four external 0.1 µF charge pump capacitors are used for the voltage doubler/inverter, permitting operation from a single 3.3 V supply.

The ADM3222 contains additional enable and shutdown circuitry. The $\overline{EN}$ input can be used to three-state the receiver outputs. The $\overline{SD}$ input is used to power down the charge pump and transmitter outputs, reducing the quiescent current to less than 0.5 µA. The receivers remain enabled during shutdown unless disabled using $\overline{EN}$.

The ADM1385 contains a driver disable mode and a complete shutdown mode.

The ADM3202 is available in a 16-lead PDIP, SOIC_W, and SOIC_N, as well as a space-saving 16-lead TSSOP. The ADM3222 is available in 18-lead PDIP and SOIC_W and in 20-lead SSOP and TSSOP. The ADM1385 is available in a 20-lead SSOP, which is pin-compatible with the LTC1385 CG.

Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

ESD CAUTION

ESD (electrostatic discharge) sensitive device. Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

Mnemonic	Description
V_{CC}	Power Supply Input (3.3 V ± 0.3 V).
V+	Internally Generated Positive Supply (+6 V nominal).
V–	Internally Generated Negative Supply (–6 V nominal).
GND	Ground Pin. Must be connected to 0 V.
C1+, C1–	External Capacitor 1 is connected between these pins. A 0.1 µF capacitor is recommended but larger capacitors up to 47 µF can be used.
C2+, C2–	External Capacitor 2 is connected between these pins. A 0.1 µF capacitor is recommended but larger capacitors up to 47 µF can be used.
Tx_{IN}	Transmitter (Driver) Inputs. These inputs accept TTL/CMOS levels.
Tx_{OUT}	Transmitter (Driver) Outputs. These are RS-232 signal levels (typically ±9 V).
Rx_{IN}	Receiver Inputs. These inputs accept RS-232 signal levels. An internal 5 kΩ pull-down resistor to GND is connected on each input.
Rx_{OUT}	Receiver Outputs. These are CMOS output logic levels.
$\overline{EN}$	(ADM3222 only) Receiver Enable. Active low. When low, the receiver outputs are enabled. When high, they are three-stated.
$\overline{SD}$	(ADM3222 only) Shutdown Control. Active low. When low, the charge pump is shut down and the transmitter outputs are disabled.
$\overline{SD}$	(ADM1385 only) Shutdown Control. When low, the charge pump is shut down and all transmitters and receivers are disabled.
DD	(ADM1385 only) Driver Disable. When low, the charge pump is turned off and the transmitters are disabled. The receivers remain active.
NC	No Connect.

GENERAL DESCRIPTION

The ADM3202/ADM3222/ADM1385 are RS-232 line drivers/receivers. Step-up voltage converters coupled with level-shifting transmitters and receivers allow RS-232 levels to be developed while operating from a single 3.3 V supply.

CMOS technology is used to keep the power dissipation to an absolute minimum, allowing maximum battery life in portable applications.

The ADM3202/ADM3222/ADM1385 are modifications, enhancements, and improvements of the AD230 to AD241 family and derivatives. They are essentially plug-in compatible and do not have any materially different applications.

CIRCUIT DESCRIPTION

The internal circuitry consists of these main sections:

- A charge pump voltage converter
- 3.3 V logic to EIA-232 transmitters
- EIA-232 to 5 V logic receivers

Charge Pump DC to DC Voltage Converter

The charge pump voltage converter consists of a 200 kHz oscillator and a switching matrix. The converter generates a ±6.6 V supply from the input 3.3 V level. This is done in two stages by using a switched capacitor technique as illustrated in Figure 18 and Figure 19. First, the 3.3 V input supply is doubled to 6.6 V by using Capacitor C1 as the charge storage element. The +6.6 V level is then inverted to generate −6.6 V using C2 as the storage element. C3 is shown connected between V+ and V_{CC} but is equally effective if connected between V+ and GND.

Capacitors C3 and C4 are used to reduce the output ripple. Their values are not critical and can be increased, if desired. Capacitor C3 is shown connected between V+ and V_{CC}. It is also acceptable to connect this capacitor between V+ and GND.

If desired, larger capacitors (up to 10 µF) can be used for Capacitors C1 to C4.

Transmitter (Driver) Section

The drivers convert 3.3 V logic input levels into RS-232 output levels. With V_{CC} = 3.3 V and driving an RS-232 load, the output voltage swing is typically ±6 V.

Receiver Section

The receivers are inverting level-shifters that accept RS-232 input levels and translate them into 3 V logic output levels. The inputs have internal 5 kΩ, pull-down resistors to ground and are protected against overvoltages up to ±30 V. Unconnected inputs are pulled to 0 V by the internal 5 kΩ, pull-down resistor. This results in a Logic 1 output level for unconnected inputs or for inputs connected to GND.

The receivers have Schmitt-trigger inputs with a hysteresis level of 0.4 V. This ensures error-free reception for both noisy inputs and for inputs with slow transition times.

HIGH BAUD RATE

The ADM3202/ADM3222 feature high slew rates permitting data transmission at rates well in excess of the EIA/RS-232E specifications. RS-232 voltage levels are maintained at data rates up to 460 kbps even under worst-case loading conditions. This allows high speed data links between two terminals and is suitable for the new generation ISDN modem standards that require data rates of 230 kbps. The slew rate is internally controlled to less than 30 V/µs to minimize EMI interference.
