## CMOS F<sup>2</sup>MC-16LX MB90540G/545G Series 16-bit Proprietary Microcontroller

The MB90540G/545G series with FULL-CAN and Flash ROM is specially designed for automotive and industrial applications. Its main features are on-board CAN Interfaces (MB90540G series: 2 channels, MB90545G series: 1 channel) , which conform to CAN V2.0A and V2.0B specifications, supporting very flexible message buffer scheme and so offering more functions than a normal full CAN approach. The instruction set by F<sup>2</sup>MC-16LX CPU core inherits an AT architecture of the F<sup>2</sup>MC family with additional instruction sets for high-level languages, extended addressing mode, enhanced multiplication/division instructions, and enhanced bit manipulation instructions. The micro controller has a 32-bit accumulator for processing long word data. The MB90540G/545G series has peripheral resources of 8/10-bit A/D converters, UART (SCI) , extended I/O serial interfaces, 8/16-bit timer, I/O timer (input capture (ICU) , output compare (OCU) ) .

### Features

- Clock
  - Embedded PLL clock multiplication circuit
  - Operating clock (PLL clock) can be selected from : divided-by-2 of oscillation or one to four times the oscillation
  - Minimum instruction execution time : 62.5 ns (operation at oscillation of 4 MHz, PLL four times multiplied : machine clock 16 MHz and at operating V<sub>CC</sub> = 5.0 V)
- Subsystem Clock : 32 kHz
- Instruction set to optimize controller applications
  - Rich data types (bit, byte, word, long word)
  - Rich addressing mode (23 types)
  - Enhanced signed multiplication/division instruction and RETI instruction functions
  - Enhanced precision calculation realized by the 32-bit accumulator
- Instruction set designed for high level language (C language) and multi-task operations
  - Adoption of system stack pointer
  - Enhanced pointer indirect instructions
  - Barrel shift instructions
- Program patch function (for two address pointers)
- Enhanced execution speed : 4-byte Instruction queue
- Enhanced interrupt function : 8 levels, 34 factors
- Automatic data transmission function independent of CPU operation
  - Extended intelligent I/O service function (EI<sup>2</sup>OS)
- Embedded ROM size and types
  - MASK ROM : 256 Kbytes / 64 Kbytes / 128 Kbytes
  - Flash ROM : 128 Kbytes/256 Kbytes
  - Embedded RAM size : 2 Kbytes/4 Kbytes/6 Kbytes/8 Kbytes (evaluation chip)
- Flash ROM
  - Supports automatic programming, Embedded Algorithm Write/Erase/Erase-Suspend/Resume commands
  - A flag indicating completion of the algorithm
  - Hard-wired reset vector available in order to point to a fixed boot sector in Flash Memory
- Erase can be performed on each block
- Block protection with external programming voltage
- Low-power consumption (stand-by) mode
  - Sleep mode (mode in which CPU operating clock is stopped)
  - Stop mode (mode in which oscillation is stopped)
  - CPU intermittent operation mode
  - Watch mode
  - Hardware stand-by mode
- Process
  - 0.5 μm CMOS technology
- I/O port
  - General-purpose I/O ports : 81 ports
- Timer
  - Watchdog timer : 1 channel
  - 8/16-bit PPG timer : 8/16-bit × 4 channels
  - 16-bit reload timer : 2 channels
- 16-bit I/O timer
  - 16-bit free-run timer : 1 channel
  - Input capture : 8 channels
  - Output compare : 4 channels
- Extended I/O serial interface : 1 channel
- UART0
  - With full-duplex double buffer (8-bit length)
  - Clock asynchronous or clock synchronized (with start/stop bit) transmission can be selectively used.
- UART 1 (SCI)
  - With full-duplex double buffer (8-bit length)
  - Clock asynchronous or clock synchronized serial (extended I/O serial) can be used.
- External interrupt circuit (8 channels)
  - A module for starting an extended intelligent I/O service (EI<sup>2</sup>OS) and generating an external interrupt which is triggered by an external input.
- Delayed interrupt generation module
  - Generates an interrupt request for switching tasks.
- 8/10-bit A/D converter (8 channels)
  - 8/10-bit resolution can be selectively used.

Starting by an external trigger input.  
Conversion time : 26.3  $\mu$ s

- FULL-CAN interfaces
  - MB90540G series : 2 channels
  - MB90545G series : 1 channel
  - Conforming to Version 2.0 Part A and Part B
- Flexible message buffering (mailbox and FIFO buffering can be mixed)
- External bus interface : Maximum address space 16 Mbytes
- Package: QFP-100, LQFP-100

16-bit Reload Timer (2 channels)	Operation clock frequency : $f_{sys}/2^1$ , $f_{sys}/2^3$ , $f_{sys}/2^5$ ( $f_{sys}$ = System clock frequency) Supports External Event Count function Signals an interrupt when overflow		
16-bit Free-run Timer	Supports Timer Clear when a match with Output Compare (Channel 0) Operation clock freq. : $f_{sys}/2^2$ , $f_{sys}/2^4$ , $f_{sys}/2^6$ , $f_{sys}/2^8$ ( $f_{sys}$ = System clock freq.)		
16-bit Output Compare (4 channels)	Signals an interrupt when a match with 16-bit Free-run Timer Four 16-bit compare registers A pair of compare registers can be used to generate an output signal		
16-bit Input Capture (8 channels)	Rising edge, falling edge or rising & falling edge sensitive Four 16-bit Capture registers Signals an interrupt upon external event		
8/16-bit Programmable Pulse Generator (4 channels)	Supports 8-bit and 16-bit operation modes Eight 8-bit reload counters Eight 8-bit reload registers for L pulse width Eight 8-bit reload registers for H pulse width A pair of 8-bit reload counters can be configured as one 16-bit reload counter or as 8-bit prescaler plus 8-bit reload counter 4 output pins Operation clock freq. : $f_{sys}$ , $f_{sys}/2^1$ , $f_{sys}/2^2$ , $f_{sys}/2^3$ , $f_{sys}/2^4$ or $128 \mu s @ f_{osc} = 4 \text{ MHz}$ ( $f_{sys}$ = System clock frequency, $f_{osc}$ = Oscillation clock frequency)		
CAN Interface MB90540G series : 2 channels MB90545G series : 1 channel	Conforms to CAN Specification Version 2.0 Part A and B Automatic re-transmission in case of error Automatic transmission responding to Remote Frame Prioritized 16 message buffers for data and ID's supports multiple messages Flexible configuration of acceptance filtering : Full bit compare/Full bit mask/Two partial bit masks Supports up to 1 Mbps		
32 kHz Sub-clock	Sub-clock for low power operation		
External Interrupt (8 channels)	Can be programmed edge sensitive or level sensitive		
External bus interface	External access using the selectable 8-bit or 16-bit bus is enabled (external bus mode.)		
I/O Ports	Virtually all external pins can be used as general purpose I/O All push-pull outputs and schmitt trigger inputs Bit-wise programmable as input/output or peripheral signal Sub-clock for 32 kHz Sub clock low power operation		
Flash Memory	Supports automatic programming, Embedded Algorithm Write/Erase/Erase-Suspend/Erase-Resume commands A flag indicating completion of the algorithm Number of erase cycles : 10,000 times Data retention time : 10 years Boot block configuration Erase can be performed on each block Block protection by externally programmed voltage

### 3. Pin Description

Pin No.		Pin name	Circuit type	Function
LQFP <sup>2</sup>	QFP <sup>1</sup>			
80 81	82 83	X0 X1	A (Oscillation)	High speed crystal oscillator input pins
78	80	X0A	A (Oscillation)	Low speed crystal oscillator input pins. For the one clock system parts, perform external pull-down processing.
77	79	X1A		Low speed crystal oscillator input pins. For the one clock system parts, leave it open.
75	77	$\overline{\text{RST}}$	B	External reset request input pin
50	52	$\overline{\text{HST}}$	C	Hardware standby input pin
83 to 90	85 to 92	P00 to P07	I	General I/O port with programmable pullup. This function is enabled in the single-chip mode.
		AD00 to AD07		I/O pins for 8 lower bits of the external address/data bus. This function is enabled when the external bus is enabled.
91 to 98	93 to 100	P10 to P17	I	General I/O port with programmable pullup. This function is enabled in the single-chip mode.
		AD08 to AD15		I/O pins for 8 higher bits of the external address/data bus. This function is enabled when the external bus is enabled.
99 to 6	1 to 8	P20 to P27	I	General I/O port with programmable pullup. In external bus mode, this function is valid when the corresponding bits in the external address output control register (HACR) are set to "1".
		A16 to A23		8-bit I/O pins for A16 to A23 at the external address/data bus. In external bus mode, this function is valid when the corresponding bits in the external address output control register (HACR) are set to "0".
7	9	P30	I	General I/O port with programmable pullup. This function is enabled in the single-chip mode.
		ALE		Address latch enable output pin. This function is enabled when the external bus is enabled.
8	10	P31	I	General I/O port with programmable pullup. This function is enabled in the single-chip mode.
		$\overline{\text{RD}}$		Read strobe output pin for the data bus. This function is enabled when the external bus is enabled.
10	12	P32	I	General I/O port with programmable pullup. This function is enabled in the single-chip mode or when the $\overline{\text{WR}}/\overline{\text{WRL}}$ pin output is disabled.
		$\overline{\text{WRL}}$		Write strobe output pin for the data bus. This function is enabled when both the external bus and the $\overline{\text{WR}}/\overline{\text{WRL}}$ pin output are enabled. $\overline{\text{WRL}}$ is write-strobe output pin for the lower 8 bits of the data bus in 16-bit access.
		$\overline{\text{WR}}$		$\overline{\text{WR}}$ is write-strobe output pin for the 8 bits of the data bus in 8-bit access.

LQFP <sup>2</sup>	QFP <sup>1</sup>			
11	13	P33	I	General I/O port with programmable pullup. This function is enabled in the single-chip mode, external bus 8-bit mode or when WRH pin output is disabled.
		$\overline{\text{WRH}}$		Write strobe output pin for the 8 higher bits of the data bus. This function is enabled when the external bus is enabled, when the external bus 16-bit mode is selected, and when the WRH output pin is enabled.
12	14	P34	I	General I/O port with programmable pullup. This function is enabled in the single-chip mode or when the hold function is disabled.
		HRQ		Hold request input pin. This function is enabled when both the external bus and the hold functions are enabled.
13	15	P35	I	General I/O port with programmable pullup. This function is enabled in the single-chip mode or when the hold function is disabled.
		$\overline{\text{HAK}}$		Hold acknowledge output pin. This function is enabled when both the external bus and the hold functions are enabled.
14	16	P36	I	General I/O port with programmable pullup. This function is enabled in the single-chip mode or when the external ready function is disabled.
		RDY		Ready input pin. This function is enabled when both the external bus and the external ready functions are enabled.
15	17	P37	H	General I/O port with programmable pullup. This function is enabled in the single-chip mode or when the CLK output is disabled.
		CLK		CLK output pin. This function is enabled when both the external bus and CLK outputs are enabled.
16	18	P40	G	General I/O port. This function is enabled when UART0 disables the serial data output.
		SOT0		Serial data output pin for UART0. This function is enabled when UART0 enables the serial data output.
17	19	P41	G	General I/O port. This function is enabled when UART0 disables serial clock output.
		SCK0		Serial clock I/O pin for UART0. This function is enabled when UART0 enables the serial clock output.
18	20	P42	G	General I/O port. This function is always enabled.
		SIN0		Serial data input pin for UART0. Set the corresponding Port Direction Register to input if this function is used.
19	21	P43	G	General I/O port. This function is always enabled.
		SIN1		Serial data input pin for UART1. Set the corresponding Port Direction Register to input if this function is used.

20	22	P44	G	General I/O port. This function is enabled when UART1 disables the clock output.
		SCK1		Serial clock pulse I/O pin for UART1. This function is enabled when UART1 enables the serial clock output.
22	24	P45	G	General I/O port. This function is enabled when UART1 disables the serial data output.
		SOT1		Serial data output pin for UART1. This function is enabled when UART1 enables the serial data output.
23	25	P46	G	General I/O port. This function is enabled when the Extended I/O serial interface disables the serial data output.
		SOT2		Serial data output pin for the Extended I/O serial interface. This function is enabled when the Extended I/O serial interface enables the serial data output.
24	26	P47	G	General I/O port. This function is enabled when the Extended I/O serial interface disables the clock output.
		SCK2		Serial clock pulse I/O pin for the Extended I/O serial interface . This function is enabled when the Extended I/O serial interface enables the Serial clock output.
26	28	P50	D	General I/O port. This function is always enabled.
		SIN2		Serial data input pin for the Extended I/O serial interface . Set the corresponding Port Direction Register to input if this function is used.
27 to 30	29 to 32	P51 to P54	D	General I/O port. This function is always enabled.
		INT4 to INT7		External interrupt request input pins for INT4 to INT7. Set the corresponding Port Direction Register to input if this function is used.
31	33	P55	D	General I/O port. This function is always enabled.
		ADTG		Trigger input pin for the A/D converter. Set the corresponding Port Direction Register to input if this function is used.
36 to 39	38 to 41	P60 to P63	E	General I/O port. This function is enabled when the analog input enable register specifies a port.
		AN0 to AN3		Analog input pins for the 8/10-bit A/D converter. This function is enabled when the analog input enable register specifies A/D.
41 to 44	43 to 46	P64 to P67	E	General I/O port. The function is enabled when the analog input enable register specifies a port.

## 5. Handling Devices

### (1) Preventing latch-up

CMOS IC chips may suffer latch-up under the following conditions :

- A voltage higher than  $V_{CC}$  or lower than  $V_{SS}$  is applied to an input or output pin.
- A voltage higher than the rated voltage is applied between  $V_{CC}$  and  $V_{SS}$ .
- The  $AV_{CC}$  power supply is applied before the  $V_{CC}$  voltage.

Latch-up may increase the power supply current drastically, causing thermal damage to the device.

For the same reason, care must also be taken in not allowing the analog power-supply voltage ( $AV_{CC}$ ,  $AV_{RH}$ ) to exceed the digital power-supply voltage.

### (2) Handling unused pins

Leaving unused input pins open may result in misbehavior or latch up and possible permanent damage of the device. Therefore they must be pulled up or pulled down through resistors. In this case those resistors should be more than  $2\text{ k}\Omega$ .

Unused bi-directional pins should be set to the output state and can be left open, or the input state with the above described connection.

### (3) Using external clock

To use external clock, drive X0 pin only and leave X1 pin unconnected.

Below is a diagram of how to use external clock.

### (4) Use of the sub-clock

Use one clock system parts when the sub-clock is not used. In that case, pull-down the pin X0A and leave the pin X1A open. When using two clock system parts, a 32 kHz oscillator has to be connected to the X0A and X1A pins.

### (5) Power supply pins ( $V_{CC}/V_{SS}$ )

In products with multiple  $V_{CC}$  or  $V_{SS}$  pins, the pins of a same potential are internally connected in the device to avoid abnormal operations including latch-up. However you must connect the pins to an external power and a ground line to lower the electromagnetic emission level to prevent abnormal operation of strobe signals caused by the rise in the ground level, and to conform to the total current rating.

Make sure to connect  $V_{CC}$  and  $V_{SS}$  pins via the lowest impedance to power lines.

It is recommended to provide a bypass capacitor of around  $0.1\ \mu\text{F}$  between  $V_{CC}$  and  $V_{SS}$  pins near the device.

### (6) Pull-up/down resistors

The MB90540G/545G Series does not support internal pull-up/down resistors (except Port0 – Port3 : pull-up resistors) . Use external components where needed.

### (7) Crystal Oscillator Circuit

Noises around X0 or X1 pins may be possible causes of abnormal operations. Make sure to provide bypass capacitors via the shortest distances from X0, X1 pins, crystal oscillator (or ceramic resonator) and ground lines, and make sure, to the utmost effort, that lines of oscillation circuits do not cross the lines of other circuits.

It is highly recommended to provide a printed circuit board artwork surrounding X0 and X1 pins with a ground area for stabilizing the operation.

### (8) Turning-on Sequence of Power Supply to A/D Converter and Analog Inputs

Make sure to turn on the A/D converter power supply ( $AV_{CC}$ ,  $AV_{RH}$ ,  $AV_{RL}$ ) and analog inputs (AN0 to AN7) after turning-on the digital power supply ( $V_{CC}$ ) .

Turn-off the digital power after turning off the A/D converter supply and analog inputs. In this case, make sure that the voltage does not exceed  $AV_{RH}$  or  $AV_{CC}$  (turning on/off the analog and digital power supplies simultaneously is acceptable) .

### (9) Connection of Unused Pins of A/D Converter

Connect unused pins of A/D converter to  $AV_{CC} = V_{CC}$ ,  $AV_{SS} = AV_{RH} = V_{SS}$ .

### (10) N.C. Pin

The N.C. (internally connected) pin must be opened for use.

### (11) Notes on Energization

To prevent the internal regulator circuit from malfunctioning, set the voltage rise time during energization at 50  $\mu$ s or more (0.2 V to 2.7 V) .

**(12) Indeterminate outputs from ports 0 and 1 (MB90V540G only)**

During oscillation setting time of step-down circuit (during a power-on reset) after the power is turned on, the outputs from ports 0 and 1 become following state.

- If  $\overline{\text{RST}}$  pin is “H”, the outputs become indeterminate.
- If  $\overline{\text{RST}}$  pin is “L”, the outputs become high-impedance.

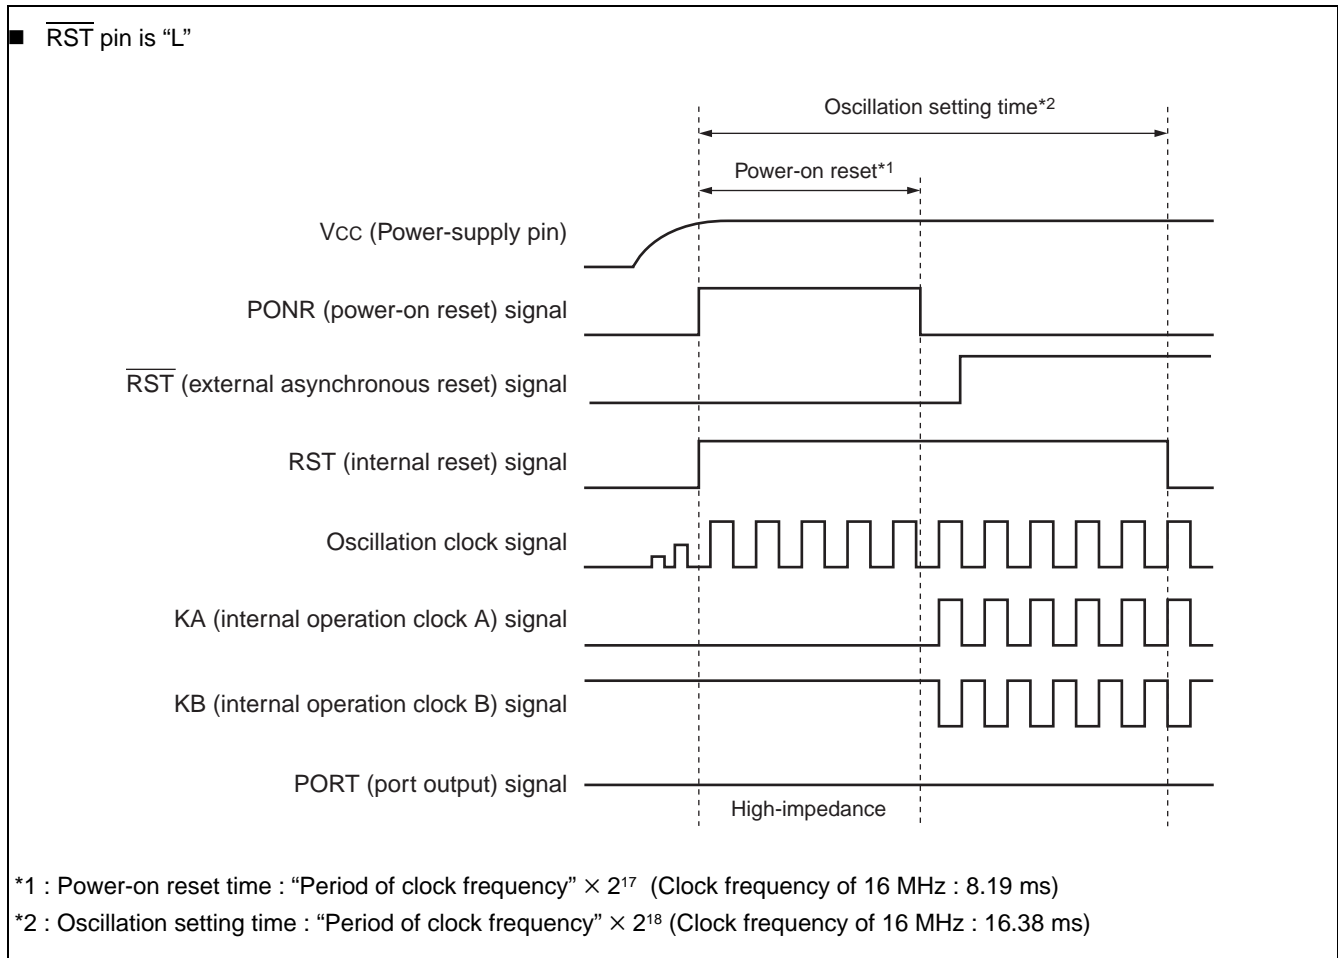

Pay attention to the port output timing shown as follow.

■  $\overline{\text{RST}}$  pin is “H”

\*1 : Power-on reset time : “Period of clock frequency”  $\times 2^{17}$  (Clock frequency of 16 MHz : 8.19 ms)

\*2 : Oscillation setting time : “Period of clock frequency”  $\times 2^{18}$  (Clock frequency of 16 MHz : 16.38 ms)

**(13) Initialization**

In the device, there are internal registers which are initialized only by a power-on reset. To initialize these registers, please turn on the power again.

**(14) Directions of "DIV A, Ri" and "DIVW A, RWi" instructions**

In the Signed multiplication and division instructions ("DIV A, Ri" and "DIVW A, RWi"), the value of the corresponding bank register (DTB, ADB, USB, SSB) is set in "00H".

If the values of the corresponding bank registers (DTB, ADB, USB, SSB) are set to other than "00H", the remainder by the execution result of the instruction is not stored in the register of the instruction operand.

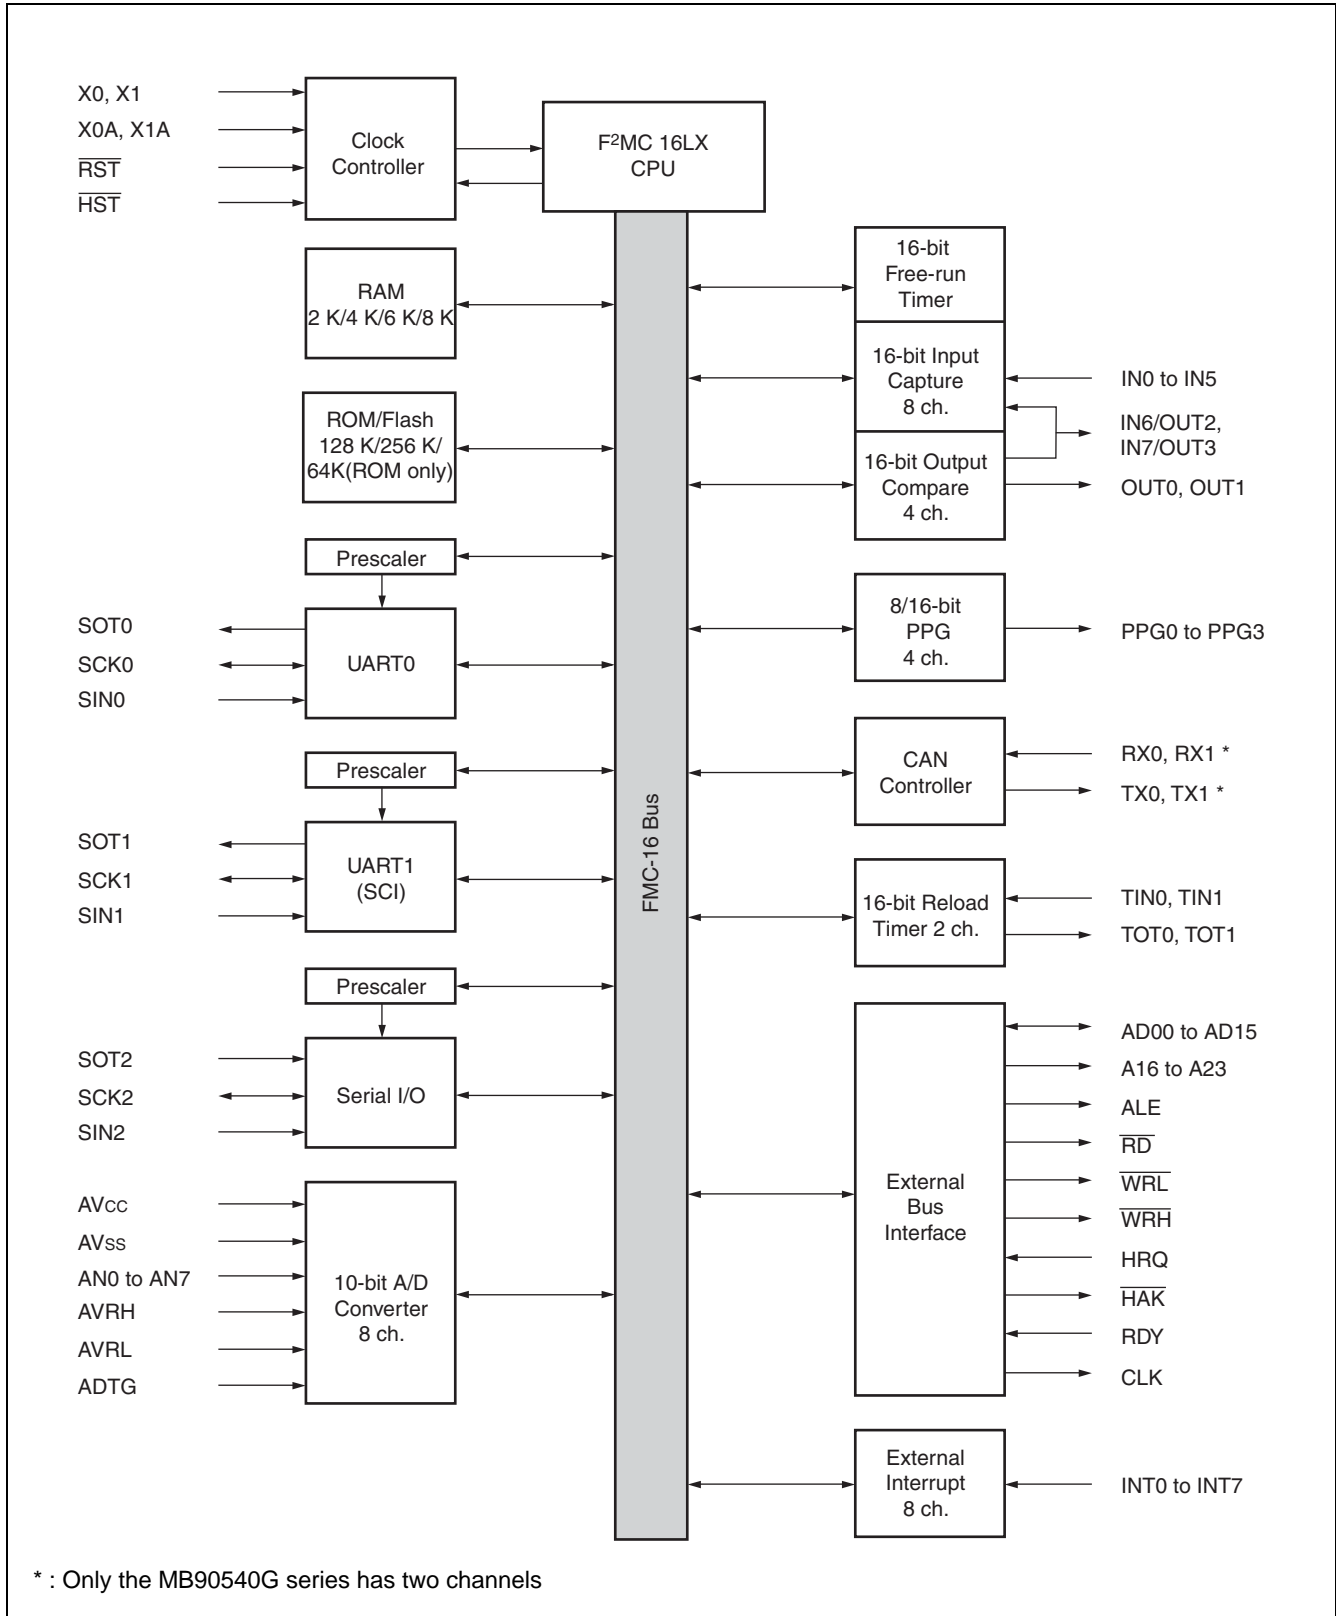

**(15) Using REALOS**

The use of EI<sup>2</sup>OS is not possible with the REALOS real time operating system.

**(16) Caution on Operations during PLL Clock Mode**

If the PLL clock mode is selected, the microcontroller attempt to be working with the self-oscillating circuit even when there is no external oscillator or external clock input is stopped. Performance of this operation, however, cannot be guaranteed.

Note : The high-order portion of bank 00 gives the image of the FF bank ROM to make the small model of the C compiler effective. Since the low-order 16 bits address are the same, the table in ROM can be referenced without using the "far" specification in the pointer declaration. For example, an attempt to access 00C000H accesses the value at FFC000H in ROM. The ROM area in bank FF exceeds 48 Kbytes, and its entire image cannot be shown in bank 00. The image between FF4000H and FFFFFFFH is visible in bank 00, while the image between FF0000H and FF3FFFH is visible only in bank FF.

■ Read/write notation

- R/W : Reading and writing permitted
- R : Read-only
- W : Write-only

■ Initial value notation

- 0 : Initial value is "0".
- 1 : Initial value is "1".
- X : Initial value is undefined.
- \_ : Initial value is unused.

Note: Any write access to reserved addresses in I/O map should not be performed. A read access to reserved addresses results in reading "X".

## 9. CAN Controller

The MB90540G series contains two CAN controllers (CAN0 and CAN1) , the MB90545G series contains only one (CAN0) . The Evaluation Chip MB90V540G also has two CAN controllers.

The CAN controller has the following features :

- Conforms to CAN Specification Version 2.0 Part A and B
  - Supports transmission/reception in standard frame and extended frame formats
- Supports transmission of data frames by receiving remote frames
- 16 transmitting/receiving message buffers
  - 29-bit ID and 8-byte data
  - Multi-level message buffer configuration
- Provides full-bit comparison, full-bit mask, acceptance register 0/acceptance register 1 for each message buffer as ID acceptance mask
  - Two acceptance mask registers in either standard frame format or extended frame formats
- Bit rate programmable from 10 Kbps to 1 Mbps (when input clock is at 16 MHz)

\*1 : The interrupt request flag is cleared by the EI<sup>2</sup>OS interrupt clear signal.

\*2 : The interrupt request flag is cleared by the EI<sup>2</sup>OS interrupt clear signal. A stop request is available.

Notes :

- N/A : The interrupt request flag is not cleared by the EI<sup>2</sup>OS interrupt clear signal.
- For a peripheral module with two interrupt causes for a single interrupt number, both interrupt request flags are cleared by the EI<sup>2</sup>OS interrupt clear signal.
- At the end of EI<sup>2</sup>OS, the EI<sup>2</sup>OS clear signal will be asserted for all the interrupt flags assigned to the same interrupt number. If one interrupt flag starts the EI<sup>2</sup>OS and in the meantime another interrupt flag is set by a hardware event, the later event is lost because the flag is cleared by the EI<sup>2</sup>OS clear signal caused by the first event. So it is recommended not to use the EI<sup>2</sup>OS for this interrupt number.
- If EI<sup>2</sup>OS is enabled, EI<sup>2</sup>OS is initiated when one of the two interrupt signals in the same interrupt control register (ICR) is asserted. This means that different interrupt sources share the same EI<sup>2</sup>OS Descriptor which should be unique for each interrupt source. For this reason, when one interrupt source uses the EI<sup>2</sup>OS, the other interrupt should be disabled.

## 11. Electrical Characteristics

### 11.1 Absolute Maximum Ratings

( $V_{SS} = AV_{SS} = 0.0\text{ V}$ )

Parameter	Symbol	Value		Units	Remarks
		Min	Max		
Power supply voltage	$V_{CC}$	$V_{SS} - 0.3$	$V_{SS} + 6.0$	V	
	$AV_{CC}$	$V_{SS} - 0.3$	$V_{SS} + 6.0$	V	$V_{CC} = AV_{CC}$ *1
	$AVRH, AVRL$	$V_{SS} - 0.3$	$V_{SS} + 6.0$	V	$AV_{CC} \geq AVRH/AVRL, AVRH \geq AVRL$ *1
Input voltage	$V_I$	$V_{SS} - 0.3$	$V_{SS} + 6.0$	V	*2
Output voltage	$V_O$	$V_{SS} - 0.3$	$V_{SS} + 6.0$	V	*2
Maximum clamp current	$I_{CLAMP}$	-2.0	+2.0	mA	*6
Total maximum clamp current	$\sum  I_{CLAMP} $	—	20	mA	*6
"L" level max output current	$I_{OL}$	—	15	mA	*3
"L" level avg. output current	$I_{OLAV}$	—	4	mA	*4
"L" level max overall output current	$\sum I_{OL}$	—	100	mA	
"L" level avg. overall output current	$\sum I_{OLAV}$	—	50	mA	*5
"H" level max output current	$I_{OH}$	—	-15	mA	*3
"H" level avg. output current	$I_{OHAV}$	—	-4	mA	*4
"H" level max overall output current	$\sum I_{OH}$	—	-100	mA	
"H" level avg. overall output current	$\sum I_{OHAV}$	—	-50	mA	*5
Power consumption	$P_D$	—	500	mW	Flash device
		—	400	mW	MASK ROM
Operating temperature	$T_A$	-40	+105	°C	
Storage temperature	$T_{STG}$	-55	+150	°C	

\*1 :  $AV_{CC}$ ,  $AVRH$ ,  $AVRL$  should not exceed  $V_{CC}$ . Also,  $AVRH$ ,  $AVRL$  should not exceed  $AV_{CC}$ , and  $AVRL$  does not exceed  $AVRH$ .

\*2 :  $V_I$  and  $V_O$  should not exceed  $V_{CC} + 0.3\text{ V}$ . However if the maximum current to/from an input is limited by some means with external components, the  $I_{CLAMP}$  rating supercedes the  $V_I$  rating.

\*3 : The maximum output current is a peak value for a corresponding pin.

\*4 : Average output current is an average current value observed for a 100 ms period for a corresponding pin.

\*5 : Total average current is an average current value observed for a 100 ms period for all corresponding pins.

\*6 :

- Applicable to pins : P00 to P07, P10 to P17, P20 to P27, P30 to P37, P40 to P47, P50 to P57, P60 to P67, P70 to P77, P80 to P87, P90 to P97, PA0
- Use within recommended operating conditions.
- Use at DC voltage (current) .
- The + B signal should always be applied with a limiting resistance placed between the + B signal and the microcontroller.
- The value of the limiting resistance should be set so that when the + B signal is applied the input current to the microcontroller pin does not exceed rated values, either instantaneously or for prolonged periods.
- Note that when the microcontroller drive current is low, such as in the power saving modes, the + B input potential may pass through the protective diode and increase the potential at the  $V_{CC}$  pin, and this may affect other devices.
- Note that if a + B signal is input when the microcontroller current is off (not fixed at 0 V) , the power supply is provided from the pins, so that incomplete operation may result.
- Note that if the + B input is applied during power-on, the power supply is provided from the pins and the resulting supply voltage may not be sufficient to operate the power-on result.
- Care must be taken not to leave the + B input pin open.

- Note that analog system input/output pins other than the A/D input pins (LCD drive pins, comparator input pins, etc.) cannot accept + B signal input.
- Sample recommended circuits :

**WARNING:** Semiconductor devices can be permanently damaged by application of stress (voltage, current, temperature, etc.) in excess of absolute maximum ratings. Do not exceed these ratings.

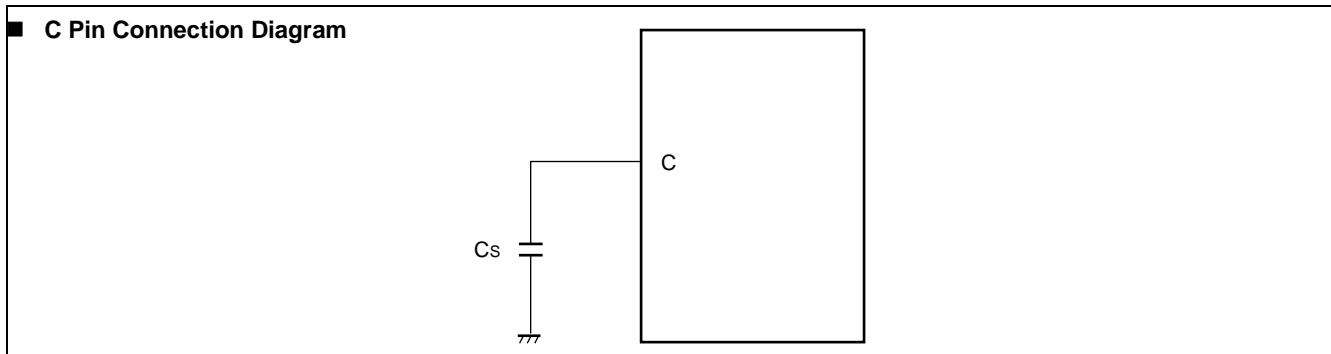

## 11.2 Recommended Conditions

( $V_{SS} = AV_{SS} = 0.0\text{ V}$ )

Parameter	Symbol	Value			Units	Remarks
		Min	Typ	Max

Operating temperature	$T_A$	-40	—	+105	$^{\circ}\text{C}$	

\*: Use a ceramic capacitor or a capacitor of better 4. AC characteristics. The bypass capacitor should be greater than this capacitor.

**WARNING:** The recommended operating conditions are required in order to ensure the normal operation of the semiconductor device. All of the device's electrical characteristics are warranted when the device is operated within these ranges. Always use semiconductor devices within their recommended operating condition ranges. Operation outside these ranges may adversely affect reliability and could result in device failure. No warranty is made with respect to uses, operating conditions, or combinations not represented on the data sheet. Users considering application outside the listed conditions are advised to contact their representatives beforehand.

\* : When not using an A/D converter, this is the current ( $V_{CC} = AV_{CC} = AVRH = 5.0 V$ ) when the CPU is stopped.

Note: The functionality of the A/D converter is only guaranteed for  $V_{CC} = 5.0 V \pm 10\%$  (also for MB90543G(S)/547G(S)/548G(S)/F548G(S)/F548GL(S)).

**11.5.2 A/D Converter Glossary**

- Resolution : Analog changes that are identifiable with the A/D converter
- Linearity error : The deviation of the straight line connecting the zero transition point (“00 0000 0000” ↔ “00 0000 0001”) with the full-scale transition point (“11 1111 1110” ↔ “11 1111 1111”) from actual conversion characteristics
- Differential linearity error : The deviation of input voltage needed to change the output code by 1 LSB from the theoretical value
- Total error : The total error is defined as a difference between the actual value and the theoretical value, which includes zero-transition error/full-scale transition error and linearity error.

$$1 \text{ LSB} = (\text{Theoretical value}) \frac{AVRH - AVRL}{1024} \text{ [V]}$$

$$V_{OT} (\text{Theoretical value}) = AVRL + 0.5 \text{ LSB [V]}$$

$$V_{FST} (\text{Theoretical value}) = AVRH - 1.5 \text{ LSB [V]}$$

$$\text{Total error for digital output } N = \frac{V_{NT} - \{1 \text{ LSB} \times (N - 1) + 0.5 \text{ LSB}\}}{1 \text{ LSB}} \text{ [LSB]}$$

$V_{NT}$  : Voltage at a transition of digital output from (N - 1) to N

**11.5.3 Notes on Using A/D Converter**

Select the output impedance value for the external circuit of analog input according to the following conditions, :

- Output impedance values of the external circuit of 15 kΩ or lower are recommended.
- When capacitors are connected to external pins, the capacitance of several thousand times the internal capacitor value is recommended to minimized the effect of voltage distribution between the external capacitor and internal capacitor.

Note : When the output impedance of the external circuit is too high, the sampling period for analog voltages may not be sufficient (sampling period = 4.00 μs @machine clock of 16 MHz) .

■ **Equipment of analog input circuit model**

**11.5.4 Error**

The smaller the | AVRH – AVRL |, the greater the error would become relatively.

## 15. Major Changes

Spansion Publication Number: DS07-13703-7E

Section	Change Results
■ PRODUCT LINEUP	Changed the name in peripheral resource. 16-bit I/O Timer → 16-bit Free-run Timer
■ I/O CIRCUIT TYPE	Changed the name of input typ. Hysteresis → CMOS Hysteresis HYS → CMOS Hysteresis
■ BLOCK DIAGRAM	Changed the arrow direction of SOT1 signal at UART1(SCI). “← →” (input/output) → “←” (output)
■ I/O MAP	Changed the text of “Note”.
■ INTERRUPT MAP	Changed the name of peripheral resource of the pin number: #19. I/O Timer → 16-bit Free-run Timer
■ ELECTRICAL CHARACTERISTICS	Changed the remarks of “parameter: Power supply voltage”.
2. Recommended Conditions	
3. DC Characteristics	Changed the maximum value of symbol : VILM of parameter: Input voltage. $V_{CC} + 0.3 \rightarrow V_{SS} + 0.3$
	Added the following remarks for parameter : Pull-down resistance. Except Flash device
4. AC Characteristics	Added the value when using an external clock in Oscillation frequency and Clock cycle time on (1) Clock Timing for parameter.
(1) Clock Timing	Added the item of A/D converter operation range in figure of “■ Guaranteed PLL operation range”
(3) Reset and Hardware Standby Input Timing	Changed the following item. (3) Reset and Hardware Standby Input Timing Remarks: In sub-clock mode, sub-sleep mode, timer mode $2t_{CP} \rightarrow 2t_{LCP}$
(4) Power On Reset	Changed as follows; Due to repetitive operation → Waiting time until power-on
5. A/D Converter	Changed the unit of Zero transition voltage and Full scale transition voltage. mV → V
■ ORDERING INFORMATION	Added the MB90F548GLPMC in Part Numbers.
