8.2	Document Revision	7
9	References	Fehler! Textmarke nicht definiert.

1 Step 1: Software

You will need the following software:

- The Arduino IDE (we used version 1.6.1)
- The TRAMS Firmware
- The Repetier-Host software (we used version 1.0.6)

2 Step 2: Installation

Install the Arduino IDE and the Arduino USB driver as shown in the official Arduino guide [Arduino installation guide](#).

Install Repetier-Host.

3 Step 3: Firmware upload

Connect the Arduino Mega without the TRAMS with the computer.

Open the "Marlin.ino" from the firmware folder with the Arduino IDE.

Select the Arduino Mega board and the correct USB port in the IDE and upload the firmware.

To test if the firmware was uploaded properly start Repetier-Host and press Strg+p.

Now choose your USB port and set the baud rate to 56000.

Click on "Connect". You should now see a similar text in the lower log window:

```
g:  Commands  Infos  Warnings  Errors  ACK  Auto Scroll  Clear Log  Cop
1.698 start
1.698 echo:
1.698 Hello World
1.702 Marlin1.0.0
1.714 echo: Last Updated: Jul 22 2015 11:20:34 | Author: (none, default config)
1.718 Compiled: Jul 22 2015
1.726 echo: Free Memory: 2478 PlannerBufferBytes: 1248
1.734 echo:Hardcoded Default Settings Loaded
1.738 echo:Steps per unit:
1.747 echo: M92 X80.00 Y80.00 Z4000.00 E100.47
1.751 echo:Maximum feedrates (mm/s):
1.759 echo: M203 X5000.00 Y5000.00 Z2.00 E25.00
1.767 echo:Maximum Acceleration (mm/s2):
1.771 echo: M201 X10000 Y10000 Z1000 E10000
```

4 Step 5: Connect with the 3D printer

Unplug the Arduino from the USB port. It should not be connected to anything right now. Put the TRAMS on the Arduino.

1. Make sure that the main power (VM) and the heat bed power (V_HEATBEAD) are **NOT** connected to a power supply! You can damage the board if you connect/disconnect parts (e.g. motors) while under power.
2. Connect the motors to the corresponding connector.
If you are using only one motor for the Z-Axis you need to connect pin 1 to 2 and pin 3 to 4 at one of the connectors.

3. Connect the end stops for the X-, Y- and Z-Axis. The Extruder normally doesn't need an end stop.

IMPORTANT:

Right now, the firmware only supports using one end stop per axis which needs to be the left one. Connect the end stops as shown here:

4. Connect the extruder thermistor to THERM_0 and the heatbed thermistor to THERM_1. (We used 100k thermistors for testing). If you don't use a heatbed you still need to connect a 110k "dummy" resistor to the THERM_1 port.

5. Connect the extruder heating cartridge to the EXT_0 connector.
6. If you have a controlled fan for cooling the printed filament you can connect it to the FAN connector. Watch out for the right polarity.

7. If you have a fan or lights which needs to be powered all the time you can connect them to the two VM ports:

8. If you have a heatbed connect it to the HEATBED port.

5 Step 6: Powering up

1. Make sure that both fuses are working properly.
2. Connect VM to 12-24V.

3. If you have a heatbed you need to connect V_HEATBED to 12-24V, too.
4. Connect the Arduino with the computer.

6 Step 7: Printing

Start Repetier-Host and click on "Connect".
Click the homing button:

Your printer should now home.
You are now ready to print.

7 Life Support Policy

TRINAMIC Motion Control GmbH & Co. KG does not authorize or warrant any of its products for use in life support systems, without the specific written consent of TRINAMIC Motion Control GmbH & Co. KG.

Life support systems are equipment intended to support or sustain life, and whose failure to perform, when properly used in accordance with instructions provided, can be reasonably expected to result in personal injury or death.
